

Individual Analysis

I think that this project overall went much better than the last project. Our product manager did an excellent job of creating user stories that were clear and detailed. Also, we made a great effort in communicating over Slack and meetings. I have to say that there was a considerable amount of communication on this project than the previous one.

I believe that the main reason this project went so well was due to the Agile Development process. For starters, I much prefer this development process over the traditional Waterfall method. I think this is because we were given the opportunity to code when wanted, while at the same time limiting the amount of documentation. The only problem that we faced with this process was the fact that some user stories required other stories to be finished first. We resolved this issue by actively communicating before a user story was pushed to development.

If there was something that I think we could have done differently, it would be that I wished we created a clear review/testing plan for the first sprint. This was a good learning opportunity and we created a thought-out process during the next sprint. Everyone's excellent retrospectives lead to this weakness being spotted and the fixed.

Overall, I enjoyed this project and team as a whole. Even though we were learning a new language and framework, we managed to get it all done in a timely manner. This project gave us the opportunity to learn something of value that is currently being used in the industry. I believe that this project will take us far into our careers.
